Qui sommes-nous ?

Une société privée non subventionnée avec une forte culture de l'innovation, dont la mission est de :

Faire le lien entre les besoins des entreprises et
la R&D issue des laboratoires de l'Université de Nantes

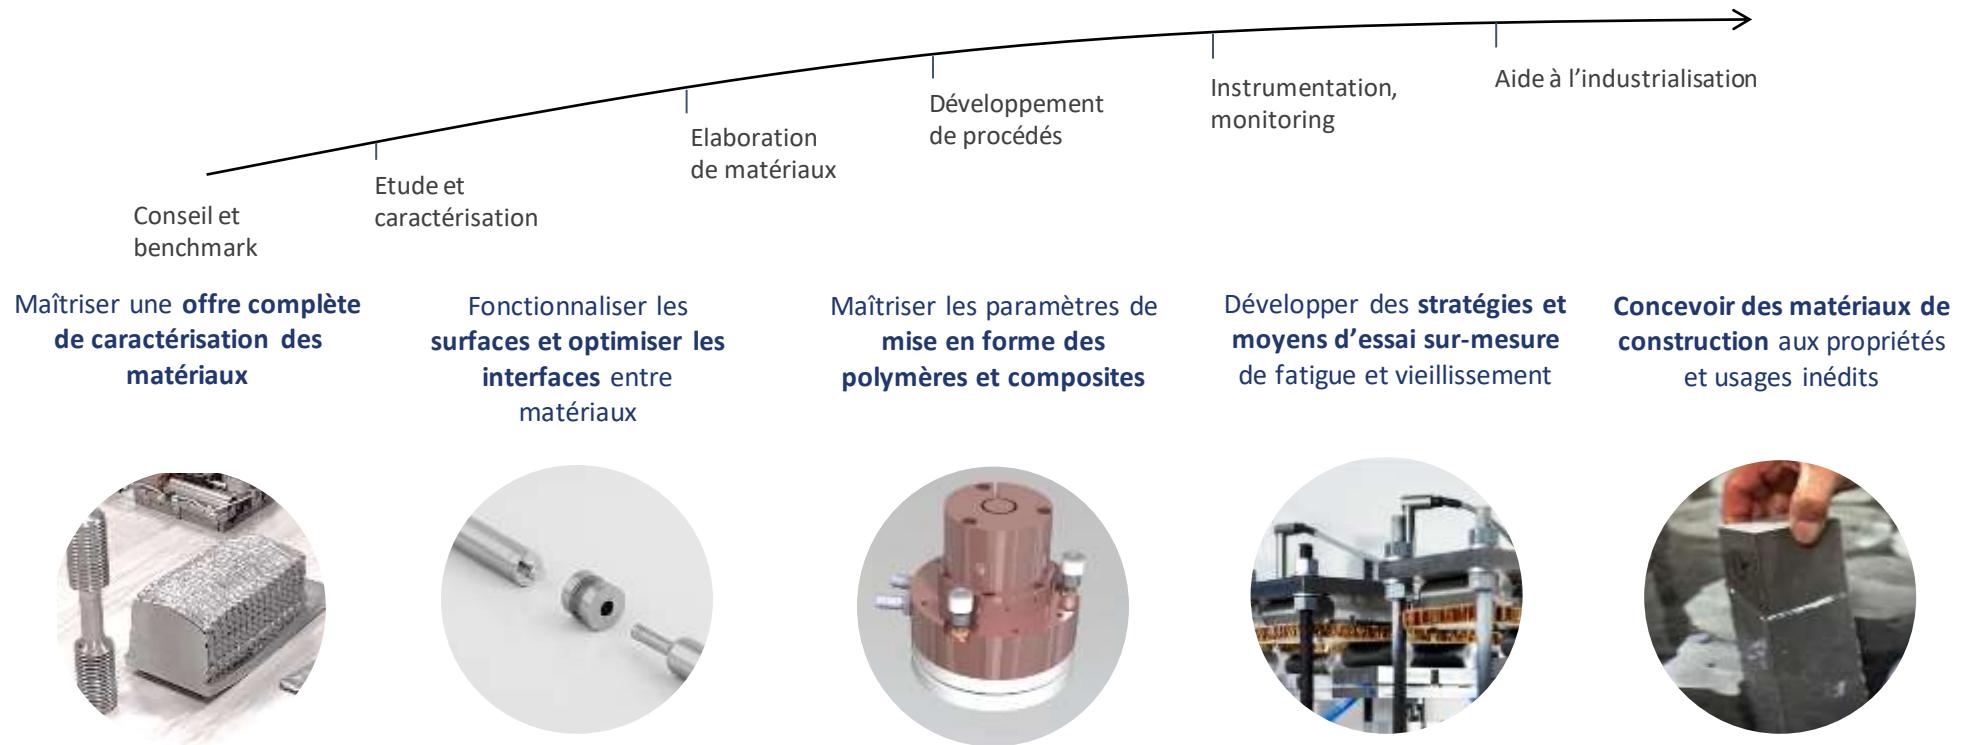

Filiale à statut privé

CAPACITÉS INDUSTRIE

Performances des matériaux

L'offre performance des matériaux s'appuie sur une équipe d'ingénieurs et scientifiques permanents pour offrir les meilleures combinaisons d'expertises possibles :

Ingénierie et chimie des matériaux

Génie mécanique

Thermique

BTP - Génie civil

Génie des bioprocédés

Exemples de monitoring

SolidSail 2.0

- Un mat de bateau de 15 mètres instrumenté par une fibre optique de 20 mètres.
- FO à retro diffusion de Rayleigh
- Patchs à jauges de déformation
- Accéléromètres
- Capteurs de force custom

Mechanism of Hydration

Components of concrete mix:

- Aggregates {
 sand
 gravel
 recycled concrete}
- Cement {
 Clinker
 Gypsum}
- Water

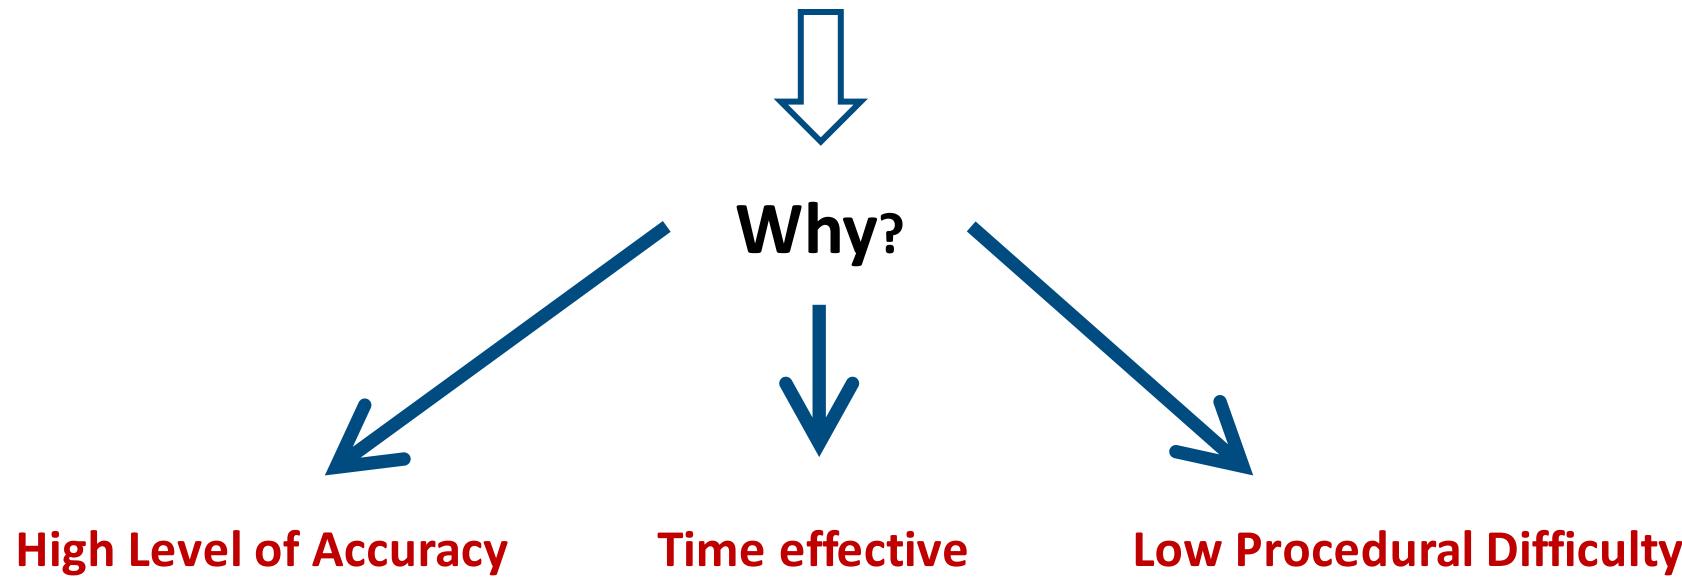

Products of Hydration:

- Hydration of Silicates {
 $C_3S_2H_3$ (*silicate calcium hydrate*)
 CH (*portlandite*)}
- Hydration of Aluminates {
 $C_6A\dot{S}_3H_{32}$ (*ettringite*)
 $3C_4A\dot{S}_3H_{12}$ (*monosulfates*)}

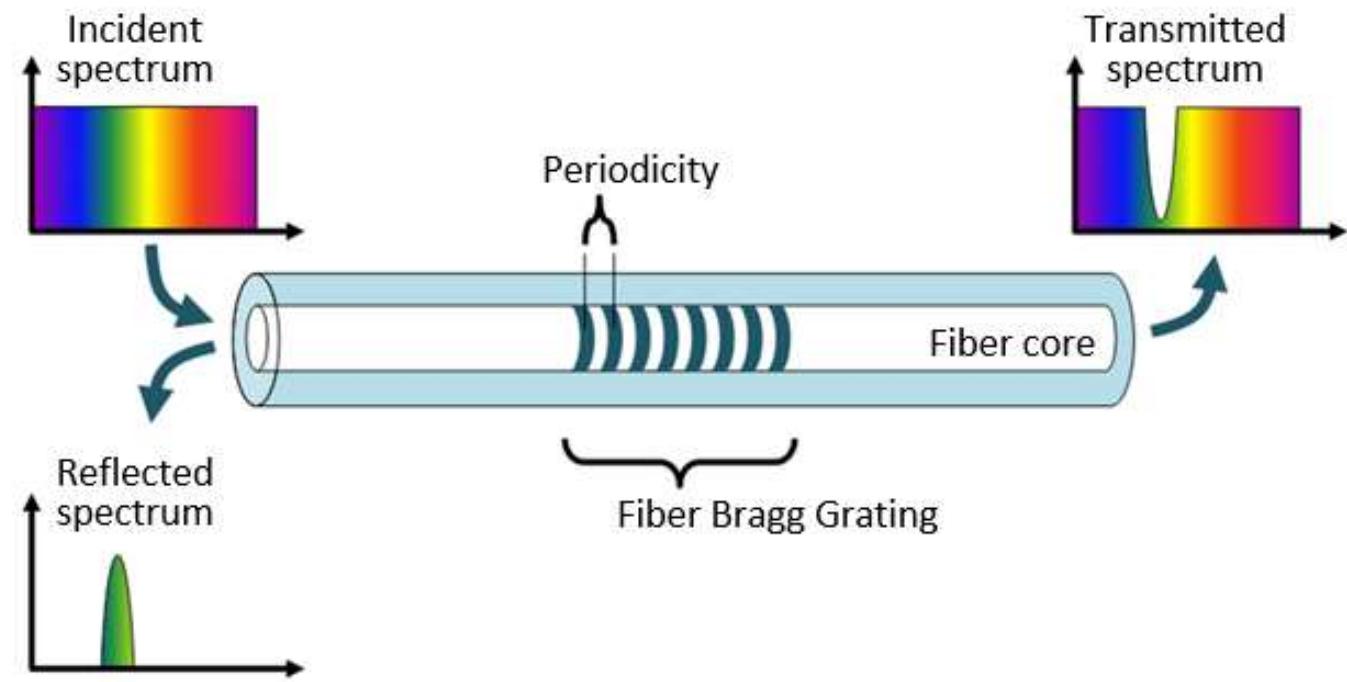

Calorimetric Curve of Portland Cement
(Gartner *et al*, 2002)

Experimental validation of the fiber optic sensors for measuring concrete deformations and temperature variations

Fiber Bragg Gratings

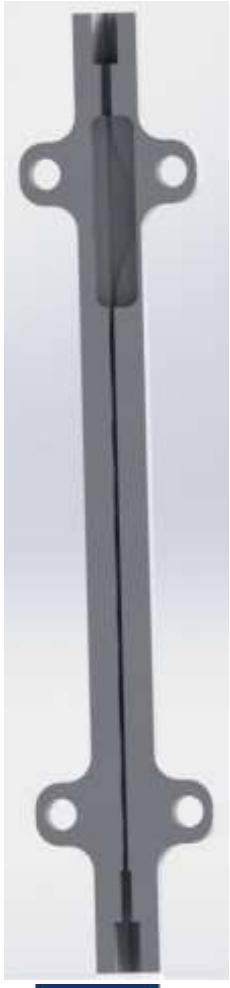

Definition: A Fiber Bragg Grating is a distributed Bragg reflector constructed in an optic fiber to reflect particular wavelengths and transmit all others[1].

[1] *Fiber Bragg Gratings (Second Edition)* 2010, pages 441-502

Description of the developed Fiber Optic Sensor

1D Fiber Optic Sensor

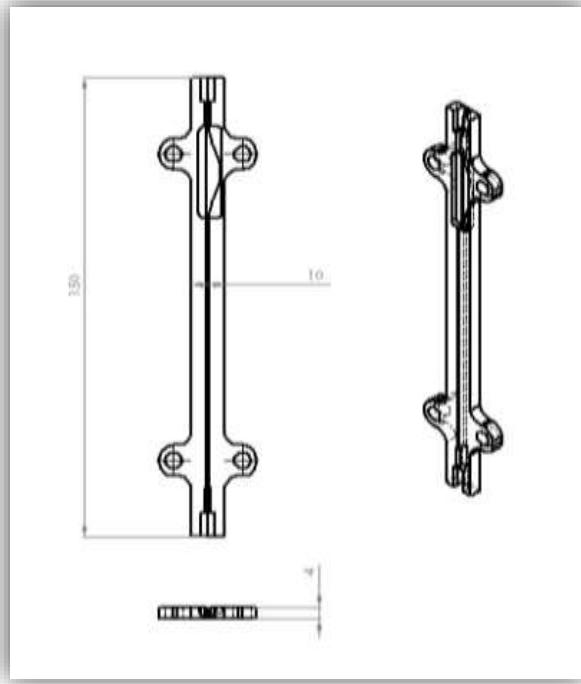

Image 1 : 1D Fiber Optic Sensor (Longitudinal Cross-Section and 3D view)

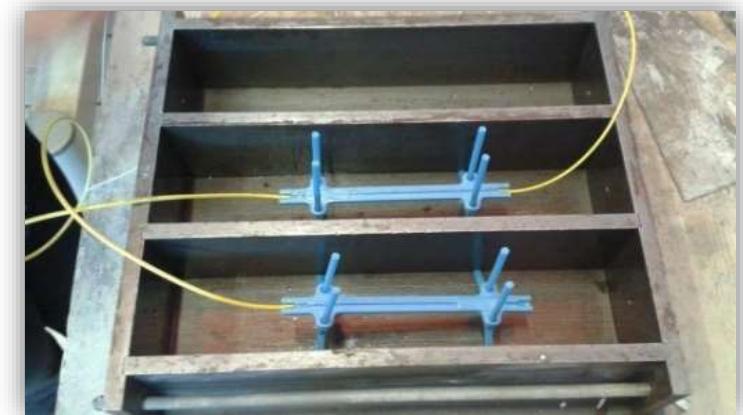

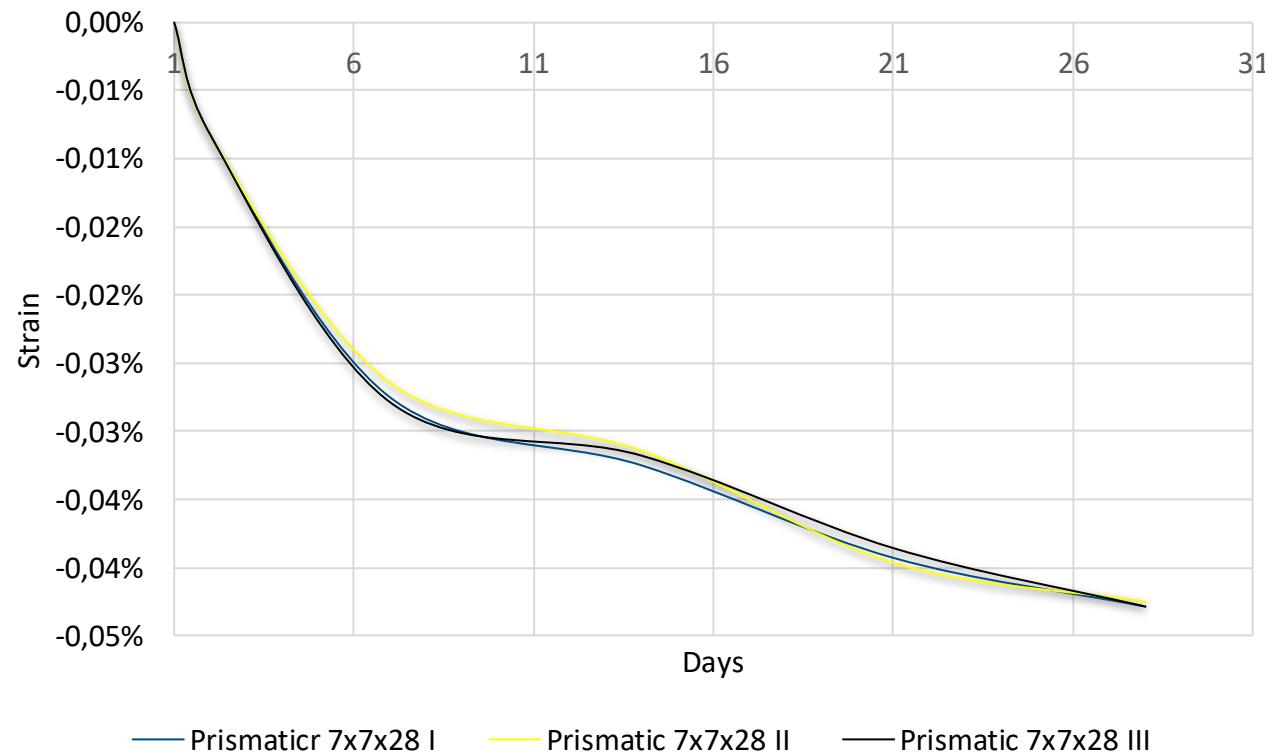

Image 2&3 : 1D Fiber Optic Sensor Prismatic Sample Setup

Image 4 : 1D Fiber Optic Sensor Cylinder Sample Setup

FBG results

Strain evolution during 28 days hardening

Temperature and Humidity variations of the storage environment

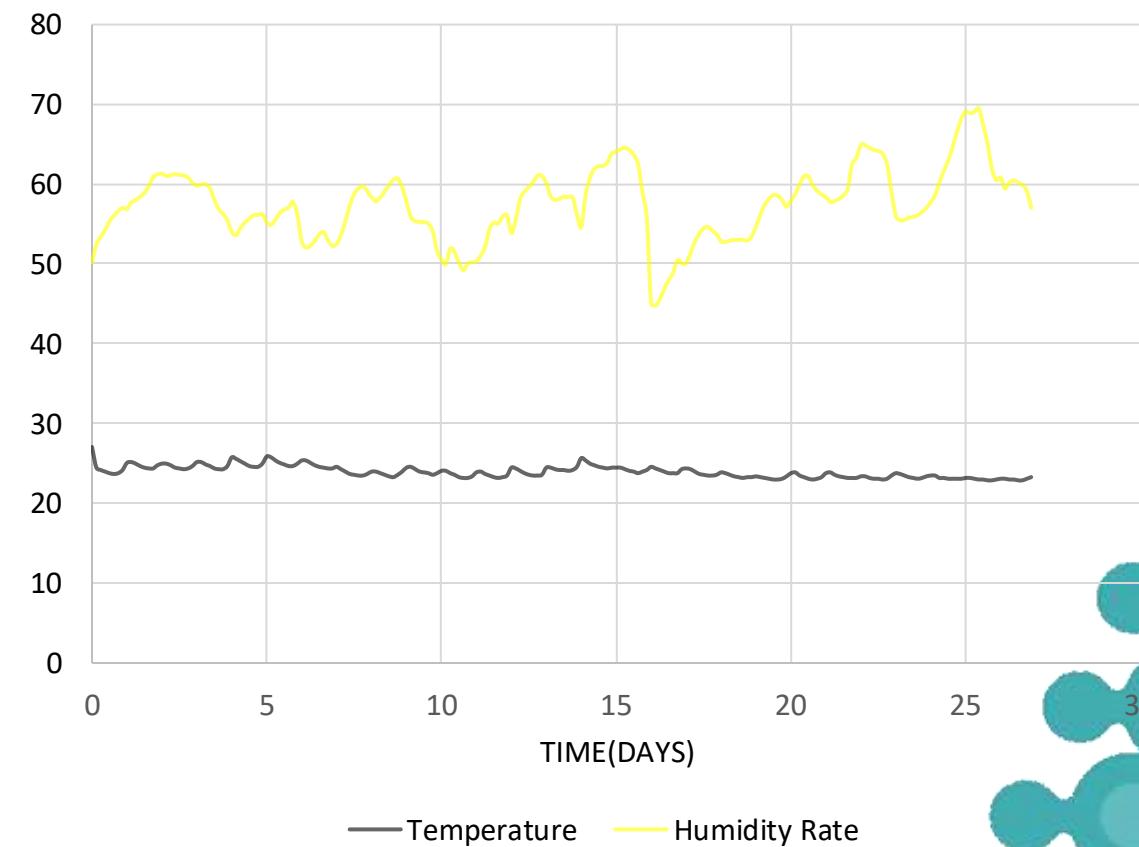

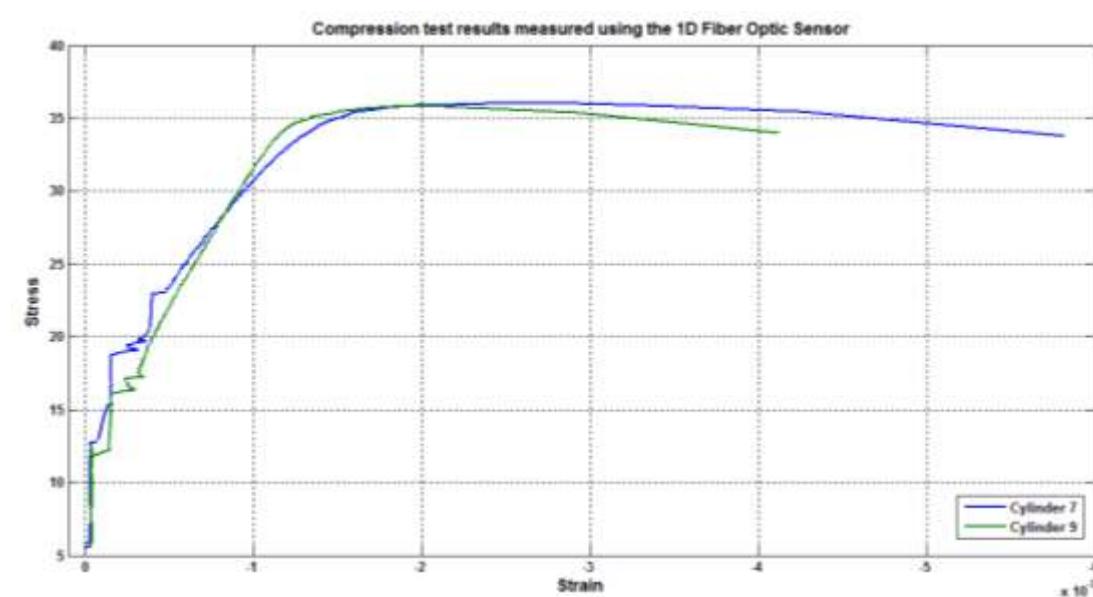

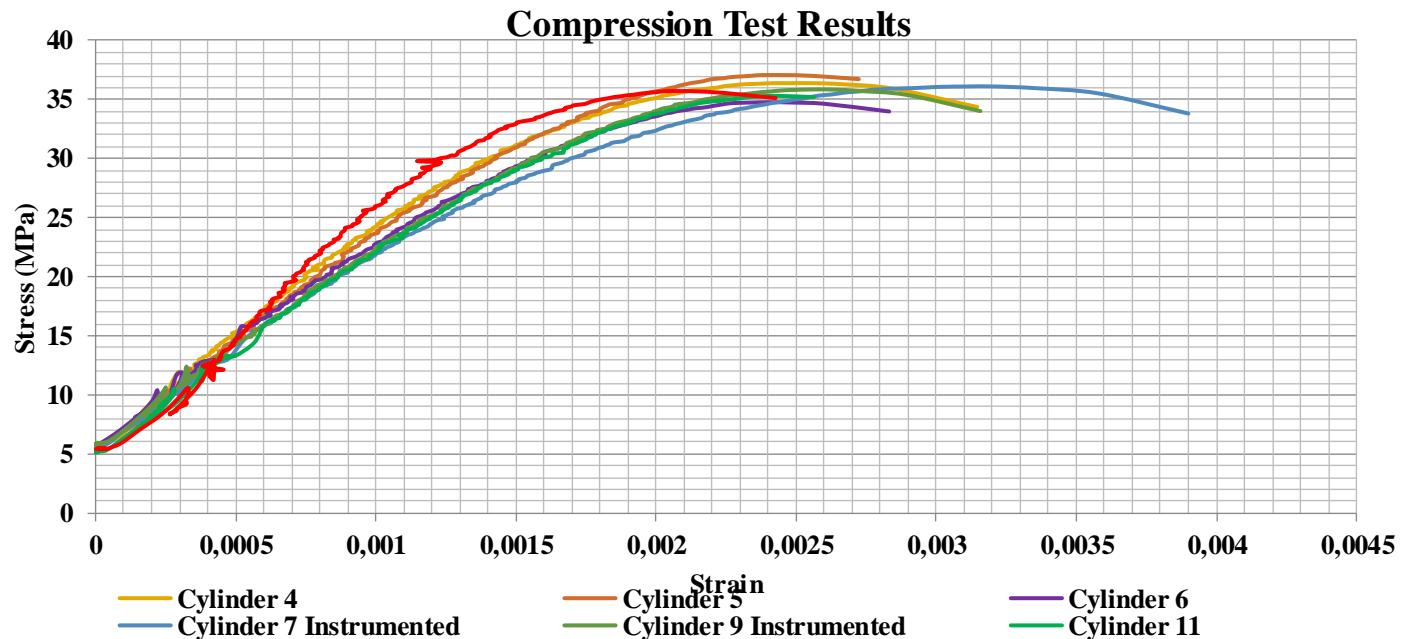

Image 5: Compression test on a non-instrumented sample

Image 6: Compression test on a instrumented sample

3D Fiber Optic Sensor

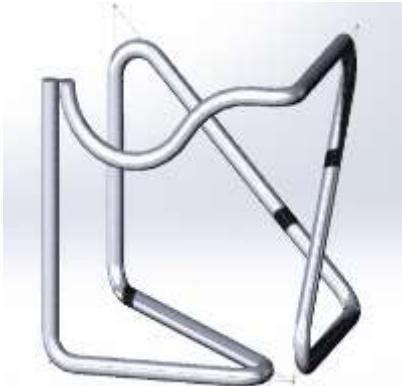

Image 11: 3D Sensor Design

Conclusion

- The fiber optic sensors are very sensible to the high temperatures occurring in the first 24h of hydration;
- The storage conditions for the instrumented samples have a big influence upon the final measurements;
- All sensors have shown a good mechanical resistance when the concrete specimens were subjected to flexion and compression tests;
- The shrinkage measurement recorded by the fiber optic sensor between the first day and the 17th day of hydration are consistent with those measured using the retractometer;
- The fiber optic sensors are capable of recorded large amounts of data in a fast and accurate manner, providing the user with sufficient information for a more detailed analysis of the behavior of concrete.
